

Four Ways for a User to Find Correct Healthcare Information Over the Internet

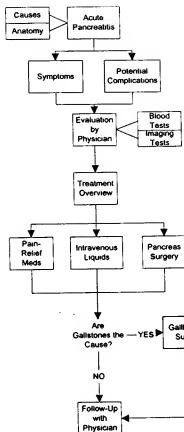

User Selects
Flowchart
"Map" Box
(which includes codes)

Code is Typed Into
a "Search" Box

Code Captured from
Electronic Medical
Record

Code is Selected
from a List of Codes

Hundreds of "Overview" maps cover all of medicine. Each is coded with the proper codes. This "engine" will allow anybody to find the right information as appropriate for where they are in the process of the disease at hand.

The process of converting ICD and CPT codes to MeSH and key words is done automatically behind the scenes since each map box is coded with all appropriate codes and words.

All "boxes" in this "Overview" map are coded with very detailed ICD and CPT codes so that the user does not have to know the correct code... it is passed correctly for them.

All ICD/CPT codes are converted into the appropriate key words, MeSH terms or other forms for the proper searching of key databases of information

User gets Web page that links to exact information which pertains to the "box" on the map. The coding within the map assures that the user will get the correct information even if they do not know the correct medical codes, or the correct MeSH terms or key words.

YourDoctor.com Articles
Journal Articles
Clinical Trials
Clinical Guidelines
Any database of information

Since the Internet is used, the databases which connect to the coding engine can be anywhere. The user of the YourDoctor.com Web Portal will be able to see content written by our expert doctors, or they can see content on any other Web site in the world as it pertains to their position within a disease... and its associated codes.
